Fall

NATIONAL AGRICULTURAL LIBRARY
RECEIVED

SEP 24 1962

U. S. DEPARTMENT OF AGRICULTURE

Per your recent request.

We are always glad to have customers come and see our stock. Our location is on the old-Winchester-highway, about a mile from Tullahoma City limits.

With 49 summers experience in the nursery business in this country, we just don't believe there is any better stock to be had anywhere. We believe that every item we offer is true. It will be graded strictly first-class of its size; if it isn't first-class it is burned.

Here you will find about all the best NEW KINDS, along with the proven old varieties. After a few frosts ripen our stock and we have the digger run, we can generally load out most any item on very short notice. COME-AND-SEE-IT!

We accept all orders subject to crop and weather conditions,—we will not be responsible for non-filling of orders caused by conditions beyond our control, such as hail, fire, frost, error in count or other causes.

We use the utmost care to keep varieties genuine and true to name, however, should any stock prove untrue to name under which it is sold,—it is agreed by both buyer and seller, that the refund of price paid for such untrue stock, or the replacement of such after proper proof has been supplied, shall be the limit of sellers responsibility.

Almost daily we are asked for a description of the newer varieties of peach: The following has been our observation of the varieties over a very wide area. VARIETIES RIPEN IN THE ORDER AS LISTED.

EARLIRE, ripens 2 to 5 days before Cardinal. The fruit is round, medium sized, about 85% of the surface is covered with a bright red brush over a yellow ground color. Flesh is yellow, firm but melting and of good flavor, a cling when firm-ripe and a semi-free when soft-ripe. Available fall 1961.

CARDINAL is an early cling, ripening about 6½ weeks before Elberta, yellow almost entirely overlaid with a bright red. The flesh is firm, of medium texture and good flavor.

DIXIRE a medium size yellow fleshed cling with bright red skin. South's biggest early money-maker.

MAYGOLD is yellow cling, attractively colored with light red over the yellow ground color. Chilling requirement is only 650 hours.

ROYALVEE ripens 2 weeks before Redhaven, medium in size and bright all-over red in color, slow oxidizing and excellent flavor, a semi-freestone but reasonably free at maturity. 9 full crops in succession indicate hardiness in bud and ability to set fruit under adverse conditions at Vineland Experiment Station, Ontario, Canada where it was originated. We will have in some quantity fall of 1961.

SUNHAVEN a medium sized yellow freestone 75 to 100% overcast with bright red, very excellent quality, 10 days earlier than Redhaven, otherwise an early Redhaven.

EARLY RED FRE heavy producer of uniformly large white fleshed, red skinned fruits. A cling until soft ripe, excellent for home markets, too soft for distant shipping.

CORONET is a yellow freestone. The fruit is medium size and has an attractive bright red over yellow, flesh is firm, smooth textured.

JERSEYLAND (sold under name of Beauty Gem) ripens just before Redhaven, bears a heavier crop of larger fruits, bright red color where fertilized heavy with nitrate, will stand more nitrate than any variety that I know and yet market quality fruit.

COMANCHEE is a yellow fleshed peach ripening 3 days before Redhaven, three-fourths covered with bright red, produces much larger fruits of excellent quality. Available fall 1961.

REDHAVEN needs no description. Same color as Sunhaven but 10 days later, is 90 to 100% bright red and is one of the most popular peaches grown.

GOLDENRED, a new peach from Oklahoma Plant Breeding Station, ripens with Redhaven, some say it is larger and better.

GOLDEN JUBILEE being dropped in favor of Ranger.

RANGER ripens with Golden Jubilee, 50% red, large, looks very much like Elberta and will ship and haul as well. Excellent quality.

KEYSTONE is a yellow free practically 100% bright red, a good new variety.

REDGLOBE ripens with Triogem, better quality in both fruit and handling. Much less susceptible to leaf spot.

TRIOGEM ripens about 3 weeks before Elberta. Fruit is medium size and attractively colored yellow freestone.

WASHINGTON is a new introduction of the Virginia Agricultural Experiment Station, Blacksburg, Va. It is a yellow freestone of outstanding size, color, firmness of flesh, texture and flavor ripening about 3 days after Triogem and 3 days before Sunhigh. It has demonstrated a superior hardiness to frost.

JULY ELBERTA ripens about 2 weeks before Elberta. Fruits are large, round and free with a yellow flesh. A good commercial variety with short chilling requirements.

RICHHAVEN is a large bright red that ripens with Halehaven, same quality of flesh. The difference is a bright, live red most all over.

HALEHAVEN is a yellow freestone. The fruit is large and round. It has been an outstanding variety for commercial planting.

SOUTHLAND is a firm yellow fleshed freestone. It is good for freezing and canning. Has a low chilling requirement.

SUNHIGH is a large attractive peach with a light, solid red skin. The flesh is yellow, fine textured and firm. Low chilling.

AMBERGEM is a yellow cling much in demand for canning.

LORING is a variety of the Sullivan's Ea. Elberta season, and is by far the best of that season. Plenty of bright red and an excellent fruit.

BLAKE ripens about 1 week before Elberta. It is a firm, yellow fleshed freestone of excellent flavor. The fruits are medium to large with an attractive red skin.

SUL. EA. ELBERTA ripens one week before Elberta,—being dropped in favor of Loring.

CHAMPION a very winter hardy and beautiful white freestone peach with a red blush honey sweet and a flavor never to be forgotten.

BELLE OF GA. a standard white fleshed, bright red markings, liked wherever planted.

ELBERTA has been the standard commercial peach for many years, the flesh is yellow, free, firm, and of good quality.

ALL-RED-ELBERTA is a sport of Elberta, is a round yellow free, practically all the fruits are 90 to 100% bright red, size of Elberta and larger, ripens with Elberta, brings a premium over any other peach at that ripening date, even a better shipper than Elberta.

REDSKIN ripens with Elberta. Its fruits are large and round, the skin is almost a solid bright red. Flesh is yellow, free and firm, a good variety for freezing and canning. Low chilling.

JEFFERSON is a yellow fleshed freestone that ripens 2 or 3 days after Elberta, a bright yellow peach with about ½ to ½ of the skin covered with a bright red blush. The flesh is above average in firmness and is comparable to J. H. Hale in texture, flavor and quality. Tree produces a heavy set of buds and the buds are very tolerant to blossoming season frosts.

J. H. HALE an old variety that needs no description.

WHITE HALE an introduction by New Jersey Fruit Breeding Assn. White with a red blush, large, hardy, honey sweet, much in demand wherever it has been tried. Ripens just after Elberta.

SHIPPER'S LT. RED ripens just following Hale. Fruit is large with a medium to bright red blush. A freestone with firm yellow flesh.

RIO-OSO-GEM a late peach, produces large fruits, with medium to bright blush, flesh yellow, free, good quality and firm, moderately productive. This variety is popular with many growers who want a late ripening peach. Brings highest price on market.
